### **OVERVIEW AND OPERATING PROCESS**

#### 1. OVERVIEW

The fuel system is a returnless type that the fuel pressure regulator is mounted inside the fuel tank. The engine ECU controls the fuel injection in each injector electronically.

According to the engine loads, the engine ECU draws or cuts off the evaporated gas in canister into the combustion chamber. The fuel system consists of fuel tank, fuel lines, fuel pump and fuel pressure regulator.

### 4. INPUT/OUTPUT DEVICES

The engine ECU calculates the accelerator pedal based on the input signals from various sensors, and controls the overall operation of the vehicle.

The ECU receives the signals from various sensor through data line, and performs effective airfuel ratio control based on these signals.

Modification basis
Application basis
Affected VIN

### **CONFIGURATION**

### 1628-04 PURGE CONTROL SOLENOID VALVE

### 1) Overview

The purge control solenoid valve is mounted on the enclosed vacuum line between the canister and intake manifold, and opens or closes the vacuum line according to the engine load conditions. When the engine reaches normal operating temperature (80°C) or exceeds the idling speed, the engine ECU operates the purge control solenoid valve. Then, the purge control solenoid valve opens the vacuum line to send the evaporeted gas in canister to the combustion chamber through the intake manifold.

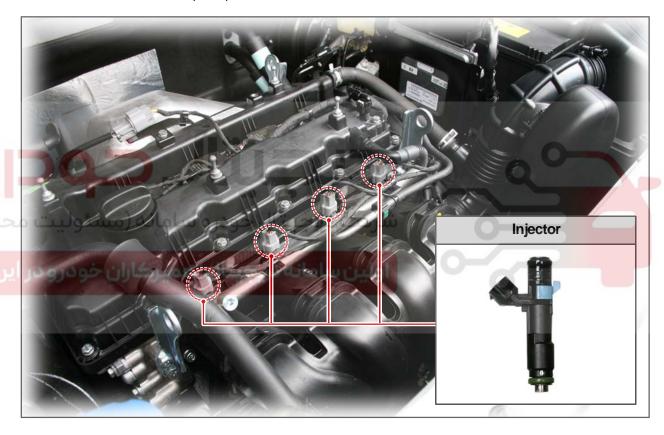

03-13

## 2245-02 INJECTOR

### 1) Overview

The engine ECU controls the injectors according to the various signals such as piston position and engine rpm. When the engine ECU sends the injection command to the injector in accordance with the injection timing, the solenoid valve in injector is magnetized and open to inject the fuel into the combustion chamber.

Fuel injection sequence: 1-3-4-2 Proper mass flow: 187.2 g/min Internal resistance: 14.5Ω (20°C)

### 2245-01 FUEL RAIL

### 1) Overview

The fuel rail is installed on the intake manifold. It contains four injectors and is the passage of fuel from the fuel pump.

- Specified fuel pressure: 3.8 ~ 4 bar
- Fuel pressure at ignition switch ON from OFF: 3.4 bar
- Remaining pressure in 30 minutes after key OFF: over 2.5 bar
- Fuel pump performance value: 35sec /  $1\ell$

03-16 2221-01

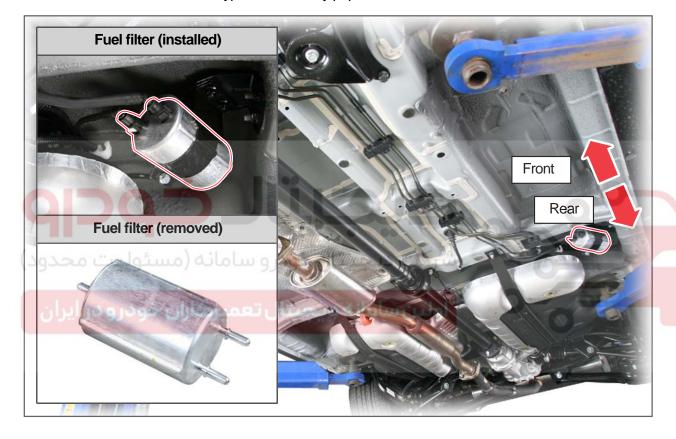

### 2221-01 FUEL FILTER ASSEMBLY

### 1) Overview

The fuel filter filters the water and dirt in fuel to prevent the engine disorder and wear of engine components. The fuel filter should be changed in specified service interval.

If the fuel filter has been used for an extended period of time, it could be clogged by dirt and foreign materials, resulting in cutting off of the fuel supply. Also, if foreign materials are delivered to the injector with the fuel may result in engine starting failure or engine disorder.

The fuel filter element is a micro type filter made by paper.

### 2221-09 CHARCOAL CANISTER

### 1) Overview

The charcoal canister is installed on the side wall of fuel tank. It collects the evaporated gas from the fuel system. It draws and accumulates the evaporated gas from the fuel tank into the canister with charcoal, and send the gas to the intake system when the engine is running.

The air filter in canister dilutes the hydrocarbon (HC) and filters the foreign materials.

- Charcoal cunister ilutes the hydrocarbon in canister and filters the foreign materials to protect the shut-off valve.

### 2211-01 FUEL TANK

### 1) Overview

To get the enough space for the propeller shaft in 4WD vehicle, the fuel tank is made in A-shape. It is made by plastic to prevent the corrosion. The fuel sender in each tank measures the fuel level by itself. The fuel in sub tank is transferred to the main pump through the jet valve in main sender.

The permissible pressure in fuel tank is double (at least 0.3 bar) of the operating pressure. To avoid excessively high pressure, there are cap and safety valve.

### 2211-06 FUEL PUMP ASSEMBLY

### 1) Overview

The fuel pump is located inside of fuel tank and operated by the engine ECU.

The fuel pump can be operated after turning the ignition switch to ON (approx. 1~2 seconds). To keep the fuel pressure in fuel system to 3.7 ~ 4.1 bar during engine running, the fuel pressure regulator is integrated in the fuel pump.

#### **▶** Requirements

Description	Specification

### 2211-05 SENDER ASSEMBLY

### 1) Overview

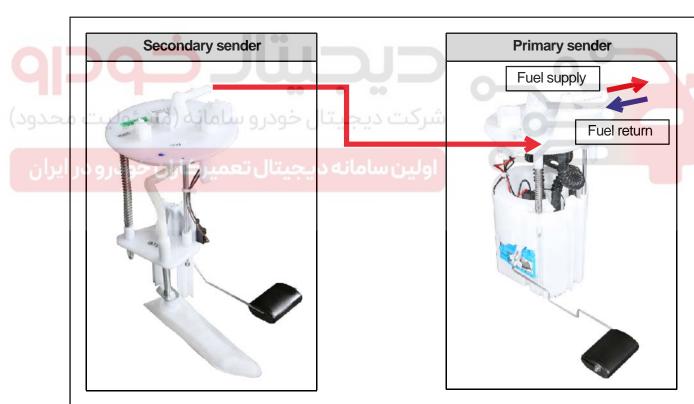

The fuel tank is divided in main tank and sub tank, and each tank has its own fuel sender (dual sender system). The fuel in sub tank is drawn into the main tank by venturi operation of orifice in jet pump of primary sender.

### 2) Operation Process

#### **▶** Fuel Sender

Fuel sender: The circuits of main sender and sub sender are parallel to each other. And the module in the instrument cluster displays the amount of remaining fuel by calculating the resistance value from the sender when the ignition switch is ON.

Low fuel level warning lamp: This warning lamp comes on when the fuel volume in the fuel tank becomes 10 L. The pointer on the instrument cluster returns to zero after the ignition is turned OFF.
